

WHAT DOES GAS DO NOW?

ELECTRICITY GENERATION

On an average day, **a third of GB power generation** comes from gas. We simply wouldn't have enough electricity without gas.

SYSTEM STABILITY

Gas helps keep the grid balanced each day, **preventing power outages** when demand outstrips renewable supply.

ENERGY SECURITY

Gas provides seasonal backup and a **critical safety net** when extreme events happen. (Like the Beast from the East).

DOMESTIC HEAT

87% of UK homes are connected to the gas grid. Most households rely on gas for heat, hot water and cooking.

INDUSTRIAL HEAT

High grade heat for manufacturing is difficult to decarbonise. **Gas is vital for powering our nation's industries.**

With the UK Government due to make a decision on the future of domestic heating in 2026, a whole system approach to net zero, that recognises the role of gas, could help us get there safely and efficiently - without leaving anyone behind.
